

Does your child enjoying playing games? Do they have normal hearing?

Enroll in our listening study!

Who are we looking for?

Children ages 6 months to 18 years who:

- have normal hearing.
- have NOT had an ear infection or ear fluid within the past 12 months.
- are from a primarily English-speaking home.
- have no history of ear tubes or ear surgery.

What does the study involve?

Your child's visit will take 1-2 hours. Several tests will be used to determine:

- how your child is hearing.
- how his/her ears are functioning.

The tests are non-invasive, do not hurt and include playing games or sitting quietly while watching videos.

A licensed audiologist will share the hearing testing results with parents at the end of the visit.

Why are we doing the study?

Our study is trying to develop better ways to diagnose, monitor and treat ear infections and fluid in the ears. To do this, we also need to compare to healthy ears, like your child has. Your participation is an important step.

Who do I contact to learn more or to sign up?

Contact the Translational Auditory Physiology and Perception (TAPP) Lab.
